

RAMSES

NEXT-GENERATION LONG BASELINE MEDIUM FREQUENCY AND LOW FREQUENCY POSITIONING SYSTEMS

RAMSES is an acoustic synthetic baseline positioning system with self-contained computing, for simple real-time sparse array subsea navigation. Tightly coupled with **iXBlue** inertial navigation system (INS), it delivers extreme precision and robustness in challenging acoustic operational environment. Available in MF and LF versions (medium frequency for most applications and low frequency for ultra-long range applications), **RAMSES** is part of **iXBlue INERTIAL-ACOUSTIC SOLUTIONS** for underwater positioning and navigation. The solution combines **RAMSES** system with GAPS and POSIDONIA **iXBlue** ultra-short baseline (USBL) positioning systems.

FEATURES

- Sparse array positioning functionality and self-calibration capability
- All in one self-contained system, including real-time position computation
- Decimeter range measurement accuracy
- Open solution environment: operates with **iXBlue** and third party transponders

BENEFITS

- Quick deployment, reduced number of transponders, and calibration-free
- Requires no top-side computer and no umbilical, enabling immediate and simplified mobilization
- Highest precision navigation, smooth and drift free positioning
- Operable within existing deployment fields, reducing operation costs

APPLICATIONS • High precision AUV/ROV subsea navigation • Subsea construction • Metrology
• Site survey • Oil and gas • Marine construction • Scientific • Defense
